Editorial

Greeting to the readers.

The present volume includes five research and review articles on various sports science discipline. In the lead article, the researchers examine correlation of fat free mass and fat mass on the anaerobic power of Indian junior weightlifters. Analysis identified that there is a positive significant correlation between anaerobic power and fat free mass, while a negative significant correlation exists between anaerobic and fat mass in both male and female.

The second article analyses imagery use between state level middle distance freestyle and individual medley male swimmers. The study reveals that there is a significant difference on one dimensions of imagery use i.e., motivational general arousal between the groups.

The third article is a review article which summarize the effect of L-carnitine supplementation on endurance athletes' sports performance outcomes. The review finding indicates that there is no significant enhancement in VO₂ max after L-carnitine supplementation and non-significant effect for carbohydrate metabolite, fat metabolite and hormones.

In the fourth article, the researchers have tried to find out the role of height and arm span on archery performance scores. It is concluded

that height and arm span have a significant linear association and significant quadratic association respectively with archery performance scores.

The last article is a review article on yoga for combating COVID-19 Pandemic and highlights yoga has a holistic approach in strengthening one's physical as well as mental health.

We hope the readers would find these studies interesting and useful.
