Editorial

This issue of the Journal carries five articles on sports and sports sciences.

The authors of the lead article compare the physical fitness and somatotype parameters of the male Hockey and Football players of JCT Phagwara.

The second article is a study of combined effect of progressive muscle relaxation, autogenic training and meditation practices on mental toughness, self-confidence, stress and anxiety among athletes. The authors found significant improvement in mental toughness and self-confidence and reduced stress and anxiety levels.

The authors of the third article study the percentage academic score of the M.P.Ed students through the administration of Rosenberg Self-Esteem Scale and found neither any significant gender based difference on self-esteem nor any significant relationship between self-esteem and academic score.

The fourth presentation studies the impact of yogic training and aerobic training on selected physical and physiological parameters among university athletes; and the researcher found significant improvement in flexibility through the yogic training and significant

improvement in breath holding time though aerobic training.

The last article determines the level of somatic and cognitive anxiety and its effect on performances of Hockey players of different genders, at junior level. The authors find that the relationship between anxiety and sports performance is not as direct as has been thought of in the past conceptualization; and consideration of the gender of the sportsperson requires gender specific research in general and different sports in particular. They recommend that while planning for intervention programmes the effect of anxiety on performance should be taken care of.

We hope you would find these presentations interesting and useful.
