This issue of the Journal presents five Research articles, on various topics related to Sports and Sports Sciences.

The lead article is the analysis of vertical jump performance of national boxers. The researchers conclude that both male and female boxers have optimum strength; but larger landing and lower take off velocity. They suggest that the boxers should incorporate proper eccentric exercises, for lower limb muscles, into their regular training schedule, to minimize the knee and back injury.

The authors of the second article study the difference in junior and senior national level players of men Volleyball teams, in terms of competitive trait anxiety and self-esteem; and find no significant difference between them.

The third article studies the effect of aerobic fitness on heart rate recovery in female fencers. The results indicate that the fencers endowed with larger aerobic zone recovered faster within the 1st minute of the recovery phase.

The authors of the fourth article compare selected physiological variables of different weight categories of elite Indian male boxers. The researchers conclude that regular analysis of physical and physiological variables of sportsmen of various weight categories, and regular counselling, can enable them achieve higher performances.

The last article presents the study of Creatine Kinase activity in Indian athletes, in order to establish its difference intervals. The researchers found that the upper reference limits were significantly higher in male athletes as compared to the female athletes, thus supporting gender difference in muscle damage after strenuous exercise.

We hope you will find the presentations interesting and useful.
