This issue of the Journal carries six articles on various topics of sports and sports sciences.

The lead article studies the performance of 100 m women sprinters, in relation to the number of strides and stride frequency. The researchers found significant positive co-relation between number of strides and stride frequency, i.e., as the number of strides decreases, the stride frequency also decreases, and vice versa.

In the second article, the researchers analyse the somato-types of , Cycling, Boxing, Wushu, Fencing and Hockey trainees of SAI Training Centre, Patiala, of 2016 training session, and provide interesting details.

The authors of the third article compare the emotional intelligence and general anxiety of the school sportspersons and non-sportspersons of Shimla district of Himachal Pradesh. They found significant difference in the variables of emotional stability, integrity and emotional intelligence, between sportspersons and non-sportspersons, and no significant difference in the variable of general anxiety.

Again, the author of the fourth article compares the emotional intelligence of athletes and non-athletes and finds a significant difference, in this variable.

In the fourth article the researcher traces the development of women in sports from the

Paris to Rio Olympics. The author concludes that there is a need to put on combined efforts, by all the stakeholders, ranging from parents, educational institutions, government bodies, sports associations and federations; and the empowerment programme must address training at all levels ; including administrative, technical aspects of sport, and leadership.

The last article presents a study of level of various physical and physiological profiles of Indian junior male and female athletes of specific events, which would help the coaches in understanding their athletes and in preparation of their training schedules.
